    }
```

cphbusiness
COPENHAGEN BUSINESS ACADEMY

```elm
import Json.Decode.Pipeline exposing (..)
```

```elm
type alias User
  = { id : Int
    , name : String
    , email : Maybe String
    }
```

```elm
userDecoder : Decoder User
userDecoder =
  decode User
    |> required "id" int
    |> required "name" string
    |> optional "email" string "no email"
```

Clone the `elm-exercises` from
`cphbus-functional-programming`

`https://github.com/cphbus-functional-programming/`
`elm-exercises`

Work on the `json.elm` file in the `basicelm` folder

Goal 1: Parse the incoming JSON to a `Person`

Goal 2: Display all the fields in the `Person` type in the HTML

Handled by the `Time` package

Handled by the Time package

```
type alias Time = Float
```

Time can be converted into

☐ Hours: `inHours :  Time -> Float`

Time can be converted into

- Hours: `inHours :  Time -> Float`
- Minutes: `inMinutes :  Time -> Float`

Time can be converted into

- Hours: `inHours : Time -> Float`
- Minutes: `inMinutes : Time -> Float`
- ... and seconds and milliseconds

Periodic updates is something in a fixed interval

Periodic updates is something in a fixed interval

Like `setInterval` in JavaScript

Periodic updates is something in a fixed interval

Like `setInterval` in JavaScript

```
every : Time -> (Time -> msg) -> Sub msg
```

Periodic updates is something in a fixed interval

Like setInterval in JavaScript

```
every : Time -> (Time -> msg) -> Sub msg
```

msg is used in update
Periodic updates is something in a fixed interval

Like setInterval in JavaScript

```
every : Time -> (Time -> msg) -> Sub msg
```

msg is used in update

```
update : msg -> model -> model
```

```
type Sub msg
```

```
type Sub msg
```

A subscription is a way of telling Elm, "Hey, let me know if anything interesting happens over there!"

```
type Sub msg
```

A subscription is a way of telling Elm, "Hey, let me know if anything interesting happens over there!"

What's the Input?

```
type Sub msg
```

A subscription is a way of telling Elm, "Hey, let me know if anything interesting happens over there!"

What's the Input? And output?

```
type Sub msg
```

A subscription is a way of telling Elm, "Hey, let me know if anything interesting happens over there!"

What's the Input? And output?

```
type Msg = Tick Time
```

```
type Sub msg
```

A subscription is a way of telling Elm, "Hey, let me know if anything interesting happens over there!"

What's the Input? And output?

`https://github.com/cphbus-functional-programming/`
`elm-exercises`

Work on the `subscriptions.elm` file in the `basicelm` folder

Goal 1: Start a subscription every millisecond

Goal 2: Update the model when the subscription arrive in the update functions

Goal 3: Set the width of the second progress-bar in the view (by correctly updating the 'progress' variable in line 51) to go from 0 to 100 once every 5 seconds.

Defined with the URI prefix: `ws` and `wss` (secure).

Defined with the URI prefix: `ws` and `wss` (secure).

Full duplex between over a single `TCP` channel.

Defined with the URI prefix: `ws` and `wss` (secure).

Full duplex between over a single `TCP` channel.

What are the pros and cons of using websockets?

```
listen : String -> (String -> msg) -> Sub msg
```

```
listen : String -> (String -> msg) -> Sub msg
```

```
type Msg = Echo String | ...

subscriptions model =
  listen "ws://echo.websocket.org" Echo
```

Clone the `elm-exercises` from
`cphbus-functional-programming`

elm-exercises

Work on the `chat.elm` file in the `websockets` folder

Goal 1: Start the node websocket server available in `server.js`

Goal 2: Connect to the websocket server on port 3000 from Elm

Goal 3: Write the response from the server to your HTML

Use the following JSON protocol
{ command: "login|send", content: "userName|message" }
and extend the `chat.elm` page to:

1. Send and receive messages in JSON

2. Display a full list of the last chat messages
   This includes changing the model to contain a list of chat messages

3. Login with a user name
   Implement this either by prefixing the user name in the button with "login" (so to log in with "Anders" you write "loginAnders"), or by creating a new input field

Use the following JSON protocol
